

Skewing

Wenheng Gao

The main content of this 3D project is to explore the dual inner world of schizophrenia patients. Because I accidentally saw a group of paintings of schizophrenic patients on the Internet, and I was deeply shocked, because who would have imagined that the mentally ill patients who lived in the ward could have such rich inner world and artistic cells? Therefore, I want to make a 3d model to express this view and discovery: by breaking stereotype, we can also appreciate a psychotic artist.

Schizophrenia inspiration

I've seen a french short movie called Skhizein, which is about schizophrenia. A 150-ton meteorite flew toward Henry, hitting the antenna upstairs opposite him, and he was physically unharmed, but mentally disturbed: he found that his mind and body had a 91cm distance, that is, he had to touch something at 91cm away! Whether you answer the phone, go to the bathroom, or even drive, you must deviate from reality. It made him panic, but even the psychiatrist didn't believe him. So he waited for another meteorite to strike, hoping the spirit could be knocked back. After the second blow, not only did he deviate 91 centimeters, but he sank down 75 centimeters, until finally his mind was completely disembodied and floating among the cosmic meteorites.

Definition of schizophrenia:

Schizophrenia mainly emphasizes the "division" between objective reality and thinking, including abnormal emotional volitional behaviors, and occasionally even the appearance of delusions and hallucinations.

Research

Survey of interviewing

The neighbor

"The patient may look like a normal person in normal times, but during the illness, he or she will appear more anxious than usual, and will have a lot of strange hallucinations"

The patient

The patient like to use colorful painting to express himself

A monster with main color of orange, red, green, brown and blue.

Survey of living environment

The hallway outside the hospital room.
-Complete medical facilities
-Information desk
-iron armrests

A bright patient room with a window.
-Infusion bag or bottle
-chair with arm

Scene Design

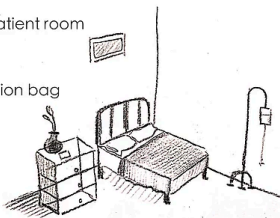

-INSPIRATION

At the Brian Gallery in southern London, artists Tim Noble and Sue Webster are holding an exhibition called Nihilistic Optimistic. Surprisingly, the main characters of the exhibition are rubbish, such as discarded and broken timber, chairs, old metals, etc., which artists combine to form abstract and seemingly meaningless sculptures. But as the lights unfold their shadows on the walls, they appear in complete and vivid shapes.

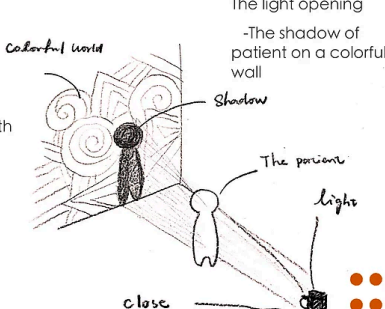

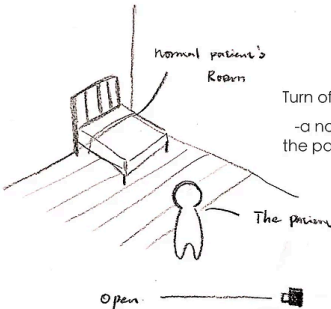

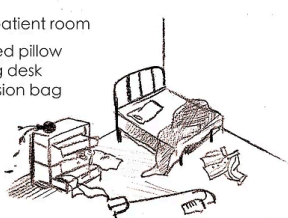

-PRACTICAL APPLICATION

Normal patient room
A bed
A desk
An infusion bag

A messy patient room
Scattered pillow
opening desk
fall infusion bag

Final Display

When the lights are placed in different positions, different scenes will appear in this 3d room.

When the light is focused on the patient, the room behind is dim and blurry, it shows Schizophrenics don't look different from normal people.

When the light is focused on the ward, it can be found that the shadow of the patient is projected on the colorful wall, and the patient's body becomes dark and fuzzy, it shows that schizophrenics live in their gorgeous inner world and they have untapped artistic potential in their hidden heart.

This is a virtual schizophrenic room
